Ruby & Gems installation on Windows

Install Ruby: <http://rubyinstaller.org/>

Start Ruby terminal and check your ruby version:

```
ruby -v
```

Clone `ktp_interface.git`:

```
git clone ktp@ktpgit.vssh.net:/opt/git/ktp_interface.git
```

If it doesn't already exist, create a Gemfile inside your project (in this case, in `ktp_interface/ktp_front_end_files`) and write this in it:

```
source 'https://rubygems.org'
gem 'rack'
```

```
gem install bundler
cd ktp_interface/ktp_front_end_files
bundle install
```

Angular webserver with rack on your own computer

https://github.com/codingforentrepreneurs/Guides/blob/master/all/angular_webserver.md

When everything is installed, move to the directory `ktp_interface` and start the application by running:

```
rackup
```

This will show you the gate number to connect to on localhost. Then open Chrome or Firefox and type the address:

```
localhost:<gate_number>
```
